# Investment Evaluation Difficulties 

B. C. Gomoi

Bogdan Cosmin Gomoi<br>Faculty of Economics, "Aurel Vlaicu" University of Arad, Romania

#### Abstract

The financial criteria used for evaluation of the enterprise are not numerous; however, they are causing heated discussion on whether using a criterion at the expense of another. The most utilized financial criteria used in the ranking of investment alternatives are: the net present value criterion, the internal rate of return criterion, the payback period limit criterion and last, but not least, the profitability index criterion. These criteria have in mind, in the first place: > investments impact on enterprise profitableness and results, by recording the future positive cash-flow > investments influence on the balance of an enterprise, traced through the evolution, on one side of the working capital ${ }^{1}$, on the other hand, the size of necessary working capital $^{2}$ > incidence of the investment project on enterprise risk level ${ }^{3}$ Therefore, to ensure the best possible decision making, investors must choose of using, and why not, even construction of relevant indicators regarding the opportunity of an investment decision in one alternative or another. It is advisable to take into account a number of

[^0]principles, which are nothing more than to highlight various aspects of technical analysis of investment projects.
As a result, it is preferable not to neglect the value of money in time problem, solved by using dynamic indicators of investment; investment project analysis with reference the binomial risk - profitableness, ensuring that profitableness of an investment is directly proportional to the risk category in which is framed; the basis for the investment decision to materialize with the help of marginal cash flow analysis and, certainly not with the help of paper profits; taking into consideration the fiscal policy of the company; elimination of the inflationary phenomenon in the decision process; targeting of low risk investment projects, because this risk adds to the whole risk of the enterprise etc.
Keywords: investment, evaluation, difficulty, financial criteria, IRR

## Internal Rate of Return

Internal rate of return on an investment is the capitalization rate of the analyzed investment project's cash-flow, which equals the net present value of the initial investment value. Under a more practical expression form, internal rate of return can be defined as the capitalization rate that equals the value totaling the cash-in-flows investments with the initial value of the investment.

To calculate the internal rate of return (IRR) on an investment, whether we are talking about an IRR of financing ${ }^{4}$, or about an IRR of investing, assuming a single sum of initial capital invested, we use the relationship:

$$
I_{0}=\sum_{t=1}^{n} \frac{C F D_{t}}{(1+I R R)^{t}}+\frac{R V_{n}}{(1+I R R)^{n}}
$$

where CFD is the size of future investment's cash-flow, $R V_{n}$ is the residual value of investment at the end of its period, and $I_{0}$ is the initial investment. Further we neglect size residual value.

From the definition we see that the internal rate of return uses upgrade technique to bring future cash flows to present, as their value significance.

[^1]For example, an investment that last 10 years, releasing a table of cash flow, summarized in the table below, according to an initial investment of 3,500 lei:

| $\mathrm{CFD}_{1}$ | $\mathrm{CFD}_{2}$ | $\mathrm{CFD}_{3}$ | $\mathrm{CFD}_{4}$ | $\mathrm{CFD}_{5}$ | $\mathrm{CFD}_{6}$ | $\mathrm{CFD}_{7}$ | $\mathrm{CFD}_{8}$ | $\mathrm{CFD}_{9}$ | $\mathrm{CFD}_{1}$ <br> 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 800 <br> lei | 700 <br> lei | 800 <br> lei | 900 <br> lei | 900 <br> lei | 850 <br> lei | 750 <br> lei | 700 <br> lei | 700 <br> lei | 700 <br> lei |

Under these conditions, internal rate of return is unique; at the rate of $18.43 \%$, due to variations of a single sign of investment flows, considering that the initial investment was introduced into the calculation with the sign - .

By this discount rate, net present value is expressed in terms of percentage return, indicated value ${ }^{5}$ being greater than the percentage of $15 \%$. The impact of one investment's internal rate of return over its policy in maximizing enterprise value is also emphasized by the net present value profile, which, practically, represents graphic of NPV variation to percentual change of cash flow discount rate.

Determination of IRR solution is difficult enough, especially under the conditions where we refer to a long period of investment project, its calculation being reduced to solution of a polynomial equation of degree $n$. Therefore, either we calculate by repeated attempts either we use the interpolation method. According to this method, internal rate of return of an investment is being estimated under the relation

$$
I R R=k_{\min }+\left(k_{\max }-k_{\min }\right) \cdot \frac{N P V_{+}}{N P V_{+}+\left|N P V_{-}\right|}
$$

Where $N P V_{+}$positive net present value of is minimum, $N P V_{-}$is negative net present value of minimum, $k_{\text {min }}$ is discount rate proper to the minimum $N P V_{+}, k_{\max }$ is discount rate proper to the maximum $N P V_{-}$. For this we must calculate a net present value set according to several discount rates. However, the calculations do nothing more than to set approximate levels on internal rate of return of the investment analysis. Salvation comes from information technology, which provides various programs for calculating the indicators of this nature. A solution would

[^2]be the utilization of $\operatorname{IRR}$ (Values; Guess) function, offered by Excel spreadsheet program.

## Rationality IRR

Investors and the enterprise concept of internal rate of return vary. Investors perceive the IRR as the minimum level of achievable profitability on an investment, while the enterprise translates internal profitability indicator as the minimum cost of invested capital. Also, the investor wants to recover his initial investment in a short period, but the enterprise aims to minimize the cost of initial investment by rescheduling on a longer period with a smaller net present value. Because the asymmetry of information is present in the market economy, investors adopt a pessimistic attitude, but they trace maximizing the most unfavorable options in future enterprise value. In contrast, the company stands at the opposite end, approaching an optimistic attitude, to determine the investor to place his equities in projects of the enterprise. All this shapes a truly strategic game, each player watching the moves of the others. The two divergent optical, translated into the language of decision theory are expressed for the investor the form $I R R_{\text {optimum }}^{\text {investor }}=\max \left[\min \left(\right.\right.$ cash flowi $\left.\left._{\text {nvestment }}=I_{0}\right)\right]$ and for enterprise
$\operatorname{IRR}_{\text {optimum }}^{\text {enterprise }}=\min \left[\max \left(\right.\right.$ cash flow $\left.\left._{\text {investment }}=I_{0}\right)\right]$. Therefore, only the managers of the enterprise are responsible with identification of equilibrium IRR.

As a result of what was said, the internal rate of return is a relevant criterion for the selection of investments, considering the average interest rate $r$, as the reference yield. Conformable to this criterion, a rational investor will choose the investment whose rate of return is more than the average reference interest rate $I R R>r$, choosing to maximize the value of this indicator. In other words, internal rate of return can be analyzed from several angles:
$>$ as the cost of capital employed in the investment;
$>$ as an opportunity cost in relation to competing investment alternatives;
$>$ as a form of minimum accepted profitability.
Reason of IRR criterion starts from the marginal analysis of future benefits corresponding to two or more investments belonging to different risk classes. An investor will choose for a risky investment as
long as the risk taken will be paid in his subjective limits of aversion against the risk. I pointed this reasoning, since a revelation of desire to obtain a maximized IRR by the investor is practically limited by investor's aversion to risk, without questioning an expected IRR rates virtually infinite anticipated.

The problem of applying the IRR criterion for assessing the investment is raising serious questions on relevant information revealed by this indicator, given that we refer to the informational value of the NPV criterion.

## Contradictory results

Determination of the importance of IRR criterion among other criteria used in evaluating investments is an extremely difficult step, the discussion starting on assumptions which started conceptualization of internal rate of return indicator and also from a series of mathematical properties of the present value function.

Need for such an approach is useful because a simultaneous use of two assessment criteria cause decision-making situations conflict. In the case of independent investment projects, application of the IRR and NPV criterion generates the same result decision. Difficulties arise when investment projects are excluded in which case the size and different time cycle are giving birth to incompatibility of results of the two investment criteria evaluation.

Although, in practice most managers use IRR criterion in financial investment decision, conceptually speaking, the NPV criterion is much better built, especially in terms of finality, and namely the reflection and measure of enterprise value maximization.

The best solution to clarify the conflicting moods aroused by the incompatibility with the IRR or NPV elections is the combined use of these criteria noting that the relevance of the IRR is deeply affected by multiple methodological flaws and interpretation. Therefore, as the prime criterion in evaluating must be used the net present value criterion, and as a criterion for choosing between investments with the same NPV we use IRR criterion.

Also, it is essential to mention that a comparative analysis of the results of the two evaluation criteria is not meant for validation of any of the alternatives investment.

If an investment project has a NPV> 0 and an IRR> $k$, the project is validated. But in the case of investments that exclude each
B. C. Gomoi
other, decisional conflict will occur in case NPV criterion nominates as one of the appropriate investment, and through the IRR criterion is decided on other investments. Equally, the need of hierarchy investments, in terms of budget restriction ${ }^{6}$, is solving in-depth analysis of all investments, by choosing investments with net present value or internal rate of return in maximum.

Next we discuss the case of investments I-IX, whose cash flows are presented in the table below:

| I | II | III | IV | V | VI | VII | VIII | IX | $\boldsymbol{X}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Relativism of IRR criterion

According to the basic objective of company's finances, enterprise value maximization can be achieved only by optimally-useful allocation of available funds in investment that provide maximum benefits. It is true that the minimum rate of return on an investment reveals the possibility of obtaining an added value in the future, compared with the initial investment, but net differentiation in favor of NPV criterion is the absolute impact on enterprise value, and not an impact on relative sizes.

[^3]For instance, an investor chooses, rather, the investment V, with a net present value of 3.054 lei and an internal rate of return of $33.43 \%$, than the investment IV with a net present value of 699 lei, but a rate of $48.76 \%$ IRR. Priority desideratum is to increase the wealth of enterprise shareholders; therefore the NPV criterion is the most indicated.

## Conflict Zone

In the figure below the NPV curves of two investments I and II are graphically represented. Through updated cash flow technique, it achieves a more severe reduction of their future value. Therefore, we see that the IRR rate lower than the corresponding rate curves intersection of the two investment NPV, conflicting situations arise between IRR and NPV criteria.

Thus, at a discount rate of future cash flows of the two investments, lower than level of $13.55 \%$, we will have a net present value of investment I smaller than of investment II, although the IRR for the investment rate I ( $20.21 \%$ ) is higher than the rate of investment II ( $16.86 \%$ ). However, if future cash flows investments are updated at a higher discount rate meeting point of two curves will be able to proceed with analysis of individual investment projects using the two criteria, and the results will converge to the same conclusion.

## Investment Size

B. C. Gomoi

Let's analyze the present value of the investment profile graphic XI and X. The investment IX is characterized by an IRR of $61.60 \%$ and a NPV of 1074 lei, while investment in X is defined by a net present value of 457 lei and a $36.35 \%$ IRR rate.

The magnitude of one investment affects alternatives investment evaluation from internal rate of return criterion perspective, once again due to the relative character of rates of return. Through an analysis of marginal cash flows, under the assumption that investment IX is an additional investment relative to investment $X$, we get the marginal cash flows:

| $\mathrm{CFDm}_{1}$ | $\mathrm{CFDm}_{2}$ | $\mathrm{CFDm}_{3}$ | $\mathrm{CFDm}_{4} \mathrm{CFDm}_{5}$ | $\mathrm{CFDm}_{6}$ | $\mathrm{CFDm}_{7}$ | $\mathrm{CFDm}_{8}$ | $\mathrm{CFDm}_{9}$ | $\mathrm{CFDm}_{10}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 500 lei 350 lei | 50 lei | 50 lei | 100 lei | 100 lei | 150 lei | 350 lei | -100 lei | -150 lei |

Given that initial marginal investment is 750 lei, we obtain a net present value of marginal investment IX-X of 182 lei, reflected under the return of return's values of $28.02 \%$. Because the marginal rate of return is higher than average interest rate by reference assumed of $15 \%$, we can sustain that the investment project $X$ is preferred to the detriment of investments X .

| NPV |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | I | II | III | IV | $V$ | VI | VII | VIII | IX | $X$ |
| 0\% | $\begin{gathered} 3850 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 5400 \\ \text { lei } \\ \hline \end{gathered}$ | 15 lei | $\begin{gathered} 2150 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 11800 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} -10500 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 3550 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 2150 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 2750 \\ \text { lei } \\ \hline \end{gathered}$ | $\begin{gathered} 1600 \\ \text { lei } \\ \hline \end{gathered}$ |

|  | Conflict zone |  | Multi ple <br> IRR | Size of investment |  | Absence <br> of IRR | Duration of investment |  | Investment Period |  |

## Investment time cycle

Also, the time cycle is a factor generating conflict situations, whereas in the case of cash flows investments from the first period, they are higher than those of other investments, enterprise will have a surplus of funds available that could place in other future investments, obtaining a higher net income than gains from other investments, because by update, with the passage of time, money today is worth less than tomorrow.

IRR criterion sets a trap to analysts under the analysis of profitable projects with different life times. For instance, investment VII, achieved on a period of 10 years, has an internal rate of return of $34.54 \%$, inferior to internal rate of return of investment VIII that is of $35.53 \%$. But investment VIII is planned to be achieved over a period of only 5 years. It would be wrong to consider investment VIII more feasible than investment IX, only on account of the internal rate of return. Therefore, if we calculate the net present value for only the first five years of investment under the case of investment VII, we will obtain a project VII internal rate of return of $23.17 \%$ and a net present value of only 217 lei, compared with net present value of investment VIII.

Therefore whole the net present value criterion is the most relevant indicator of discrimination against investments, investments more or less feasible.

## Reinvestment to constant rate

Internal rate of return was defined as being the discount rate of cash flow investment analysis, to cover the full amount of initial investment. But it went wrong at least realistic assumption of constant reinvestment under the same company and at the same IRR of future cash flow.

To solve this it proceeded to accept the assumption of reinvestment of future benefits at a rate of return of the enterprise, and not of investment project, by the size of enterprise capital cost. Modified internal rate of return, abbreviated MIRR is being calculated
by the relationship: $\quad M I R R=\sqrt[n]{\frac{\sum_{t=1}^{n} C F D_{t} \cdot(1+d)^{n-t}+R V_{n}}{I_{0}}}-1$, where $d$ is enterprise specific rate of return that can be reinvested future cash flows.

Clearly as the size of internal rate of return depends directly of positioning of the IRR from benchmark rate stock market $d^{7}$, representing the average interest rate on risk-free securities, as shown from the values below:

| $\boldsymbol{d}$ | $10.00 \%$ | $15.00 \%$ | $20.00 \%$ | $25.00 \%$ | $30.00 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| MIRR $_{\boldsymbol{I}}$ | $13.70 \%$ | $16.85 \%$ | $20.07 \%$ | $23.36 \%$ | $26.71 \%$ |
| MIRR $_{\boldsymbol{I I}}$ | $13.79 \%$ | $16.00 \%$ | $18.34 \%$ | $20.80 \%$ | $23.37 \%$ |

It can be noticed that as long as the enterprise reinvestment rate is higher IRR rate, we will achieve modified growth rates of return. But rates of reinvestment lower than IRR generate increasing diminution of the modified internal rate of return.

## Multiple solutions

Another problem utilizing IRR in investment selection is the multiple solutions problem. This problem occurs only if the investment

[^4]projects whose cash flow varies in the future, as an algebraic sign, from one period to another. The situation can be met if there is need for additional investment in the future, whether it's legal obligations, or extensions of the life of the investment.

As we can see in the graphic, the NPV curve that characterizes investment III, cuts the x-axis in three points, meaning the investment has three internal rates of return. They are determined by solving the mathematical equation of degree 10 polynomial.

In the case of the investment III we get three internal rates of return because we have three shifts of signs concerning the evolution in time of cash-flows. For the first internal rate of return is being used the function IRR of the Excel spreadsheet program, but the problem arises when determining the other two unknown rates of return. For this we will use the method of calculating the IRR through interpolation with the relation

$$
I R R=25 \%+(30 \%-25 \%) \cdot \frac{1}{1+|-1|}=27.5 \% \quad . \quad \text { Analog } \quad \text { will }
$$

obtain the last value multiple of $52.5 \%$ IRR.

In these cases, abandon the use of the IRR criterion of investment evaluation considering it viable for the net present value criterion.
B. C. Gomoi

## IRR absence

Due to mathematical construction from which we started determining the internal rate of return, we've come to the situation where determining this kind of rate is difficult, at the expense of solving polynomial equation resulting from equating the net investment with present cash flow sum and with unknown IRR.

There are situations in which the equation that was just mentioned doesn't accept real solutions; therefore, we're assisting at an evaluation project of investment characterized through the absence of internal rate of return.

In this case, investment $V I$ is characterized by strictly negative net present values, in case we go through the interval of discount rates [5\%-100\%].

Net present value profile

If the discount rate tends to a very high value, present coefficient tends to the initial value of investment, which causes the gradual cancellation of the importance value discounted cash-flow. This behaviour can be described more than a perpetual investment in the scheme, ${ }^{8}$ in which case the present value of cash-flows is given by

[^5]$N P V=\frac{C F D}{I R R}-I_{0}$. In addition to this asymptotic behaviour arises the financial practice problem, which doesn't look at situations of very high profitableness, since such situations are impossible at the level of analysis in absolute values.

## Conclusions

An investments internal rate of return has won an important place in decision making in the analysis of financial practices of the largest enterprises. But scientific research has shown that such a criterion is relevant only in terms of comparative analysis of independent investment projects, those you can use assessing the feasibility of investment into the truth of the relationship IRR> $d$. Also, a depth analysis of investment projects can be used as a useful tool in their classification, given that the economic situation imposes restrictions on enterprise financing. Therefore, indivisible priority projects ${ }^{9}$ that are intended to be done are those projects with the highest values of the internal rates of return.

A use for the IRR criterion raises numerous conflicting situations, starting from incompatibility of the results obtained through evaluation using the IRR criterion and, also, NPV criterion. Conflicting statements are limited to investment projects whose related net present values curves intersect. Also, methodological insufficiencies make their way in the valuing of information offered by the application of the IRR criterion for investment evaluation: multiple IRR solutions, IRR absence, or the unrealistic assumption of reinvestment of future benefits at a constant rate of non-specific general business risk and profitability enterprise etc.

All these remarks don't have as purpose minimising the informational value of the internal rate of return, but only to draw a fine attention to the weaknesses and traps set by utilising this indicator.
